

PRAVEEN KODAVALI

+91-6300033822 | praveenkodavali2001@gmail.com | linkedin.com/in/praveenkodavali2001

TECHNICAL SKILLS

Languages: Python, Java, SQL

Frameworks & Tools: FastAPI, Spring Boot, ReactJS, Apache Airflow, Apache Spark, Databricks, n8n, GA4

Developer Tools: VS Code, Postman, Git, Eclipse, PyCharm, Docker, Jira

Databases: MongoDB, PostgreSQL, MySQL

EXPERIENCE

Software Engineer (SDE-II)

July 2023 – Present

NucleusTeq - Nuodata

Raipur, Chhattisgarh

- Designed and building a next-generation low-code / no-code orchestration platform on Apache Airflow with a drag-and-drop UI, reducing the need for extensive coding while enabling rapid workflow creation at scale and addressing usability gaps in existing orchestration ecosystems.
- Implemented an AI Agent orchestration framework in Apache Airflow by building custom AI Agent operators, agent-type-specific payload factories, and standardized XCom-based input/output contracts, enabling seamless integration of external AI services into automated workflows.
- Designing and implementing Human-in-the-Loop (HITL) capabilities allowing AI-driven workflows to pause for human validation and resume execution, supporting multi-channel interactions and improving trust, governance, and decision accuracy in AI workflows.
- Designed a Trigger Framework supporting multiple event types schedule-based, file-based, and table-update-based triggers enhancing workflow flexibility and automation coverage.
- Designed and developed reusable database connectors for the platform using SQLAlchemy and Spark, enabling seamless integration with Oracle, BigQuery, MySQL, Iceberg, and other databases to power ETL pipelines and data synchronization.
- Developed a dedicated microservice for Liquibase-based MongoDB evolutions, enabling automated version control and seamless deployment of schema changes across environments.
- Architected a cloud-agnostic system using the Factory Pattern for dynamic selection of AWS and GCP services, refactoring storage, secrets and database configurations to support multi-cloud deployments.
- Conducted comprehensive research on Change Data Capture (CDC) tools including Kafka, Debezium, and Airbyte, analyzing architecture and performance metrics for real-time data synchronization capabilities.
- Integrated Google Analytics 4 (GA4) into the product dashboard, implementing event tracking and custom metrics to enable data-driven decision-making and improved user engagement insights.
- Led bug tracking initiatives by identifying, documenting, and reporting product issues while collaborating cross-functionally for resolution, contributing directly to fixing critical problems affecting stability.

PROJECTS

Optica — AI-Powered Incident Intelligence Platform | *Building*

[GitHub](#)

- Building an open-source AI platform that helps engineering and SRE teams resolve production incidents faster — surfacing similar historical incidents using hybrid RAG (BM25 + semantic search via LangChain EnsembleRetriever) and returning structured root cause analysis with confidence scores.
- Implemented Keycloak-backed multi-tenant RBAC with team-scoped vector retrieval enforced at the SQL layer using pgvector — ensuring zero cross-team data leakage even inside RAG queries.
- Designed MCP-style tool calling where the AI agent queries the live GitHub Releases API before generating recommendations — grounding responses in real deployment context rather than hallucinated answers.
- Built async document ingestion pipeline using RabbitMQ and Celery — API returns immediately while workers handle chunking, embedding generation, and vector storage independently at scale.

CERTIFICATIONS

Astronomer Certification: DAG Authoring for Apache Airflow 3
